

# Modelos y Optimización I

## TP3

Nombre: Nicolas Ronchese Marcotegui
Padrón: 108169

**Aclaración:**

Perdón si el largo se pasa del esperado, pero a la hora de pasar los engine logs no me terminaba de cerrar la forma que tomaban cuando los copiaba y pegaba del oplode, por eso decidí incluirlos en formato de foto, lo que llevó a que ocuparan más espacio del esperado. eso sumado a que las soluciones normalmente ocupaban 2 páginas, esto alargó notablemente la longitud del informe.

1) solución obtenida con una de las heurísticas del tp2:

### Análisis:

En 10 minutos no encontré la solución óptima, esto se puede ver en el gap que le falta para terminar.

Se puede ver que ya encontré una solución mejor que la mía y encontré 19 soluciones enteras como mínimo. Sumado a esto se ve como las primeras soluciones mejoran ampliamente el resultado de las anteriores y mientras más avanza el modelo menos mejoran los resultados, parece que le costó especialmente mejorar los resultados de 149 y 122.

Viendo la columna de **ItCnt** se pueden apreciar conclusiones similares a las del párrafo anterior donde a mejor solución más aumenta el número de interacciones que hace el modelo para encontrar soluciones.

### Conclusión:

En este caso el modelo está buscando dentro de todas las soluciones posibles, entonces si bien el modelo es válido y seguramente si lo dejo ejecutarse un tiempo ilimitado encuentre la solución cada avance que haga requerirá más **ItCnt** ya que no hay nada que le simplifique a la hora de seleccionar que camino tomar.

CPXPARAM TimeLimit 600

Legacy callback pi

Tried aggregator 1 time.

MIP Presolve eliminated 13053 rows and 0 columns.

MIP Presolve modified 1347 coefficients.

Reduced MIP has 3945 rows, 2085 columns, and 13532 nonzeros.

Reduced MIP has 2070 binaries, 15 generals, 0 SOSs, and 0 indicators.

Presolve time = 0,04 sec. (23,27 ticks)

Found incumbent of value 300,000000 after 0,07 sec. (37,25 ticks)

Probing time = 0,04 sec. (4,04 ticks)

Tried aggregator 1 time.

Detecting symmetries...

Reduced MIP has 3945 rows, 2085 columns, and 13532 nonzeros.

Reduced MIP has 2070 binaries, 15 generals, 0 SOSs, and 0 indicators.

Presolve time = 0,02 sec. (12,94 ticks)

Probing time = 0,07 sec. (4,04 ticks)

Clique table members: 1875.

MIP emphasis: balance optimality and feasibility.

MIP search method: dynamic search.

Parallel mode: deterministic, using up to 8 threads.

Root relaxation solution time = 0,20 sec. (148,88 ticks)

**Análisis:**

En 10 minutos no encontró la solución óptima, parece que está cerca por el gap pero al poner el límite de 10 minutos terminó la ejecución.

Encontró 10 soluciones enteras. A diferencia del punto anterior los primeros incrementos fueron abruptos (la foto del stats es realizada antes de tiempo para evidenciar esto) hasta que se estancó en 117.

Se puede apreciar que el límite de 15 lavados mejoró la velocidad de la solución ya que no solo la primera solución encontrada es mejor que en el caso anterior sino que también se estancó menos (exceptuando en 117 que podría ser el óptimo). También se ve en la columna **ItCnt** aumenta más paulatinamente que sin la limitación de los lavados

**Conclusión:**

Limitar la cantidad de lavados le facilita al modelo tomar ejecutarse ya que desde un principio puede descartar soluciones que en el caso anterior tuvo que analizar. De todas formas y a pesar de achicar bastante el gap, hay muchas formas de generar el valor 117 y modelo probará todas las soluciones hasta confirmar que esta es la óptima

**Análisis:**

En 2:54 minutos aproximadamente encontró la solución óptima, a pesar de que falta gap el hecho de que la ejecución termine por su cuenta me hace llegar a esta conclusión aunque esto puede deberse a las restricciones que agregue la simetría.

Encontró 27 soluciones enteras. A diferencia del punto anterior este modelo parece no haberse estancado, el avance es continuo.

Se puede ver que la simetría mejoró la velocidad de la solución, si bien las primeras soluciones encontradas son bastante peores que en el caso anterior, este modelo terminó antes de llegar al límite de los 10 minutos. Sumado a esto, se ve que la columna **ItCnt** aumenta más paulatinamente y nunca pasando los 1,000,000 lo que podría explicar la velocidad de su resolución

**Conclusión:**

Por lo que entendí, la simetría garantiza que los primeros lavados tienen que ser los que más tiempo demoran, esto descarta soluciones que se componen de los mismos lavados en diferente orden. Esta restricción parece simplificar el problema de forma tal que no necesita utilizar los 10 minutos que tiene disponible para encontrar una solución ,a pesar de comenzar con una solución inicial tan alta.

**Análisis:**

En 27 segundos aproximadamente encontró la solución óptima, a pesar de que falta gap el hecho de que la ejecución termine por su cuenta me hace llegar a esta conclusión.

Encontró 13 soluciones enteras. En su mayoría el avance fue continuo, con algunas demoras en la solución de valor 119 .

Se puede ver que la combinación de la simetría con el límite de lavados mejoró la velocidad de la solución, esté incluso comenzando en un mejor punto de partida que en el punto anterior y similar al de punto 3. Este modelo terminó antes de llegar al límite de los 10 minutos. La columna **ItCnt** nunca pasando los 500,000 y se mantiene la mayor parte de su ejecución entre los 100,000 y los 200,000 lo que podría explicar la velocidad de su resolución

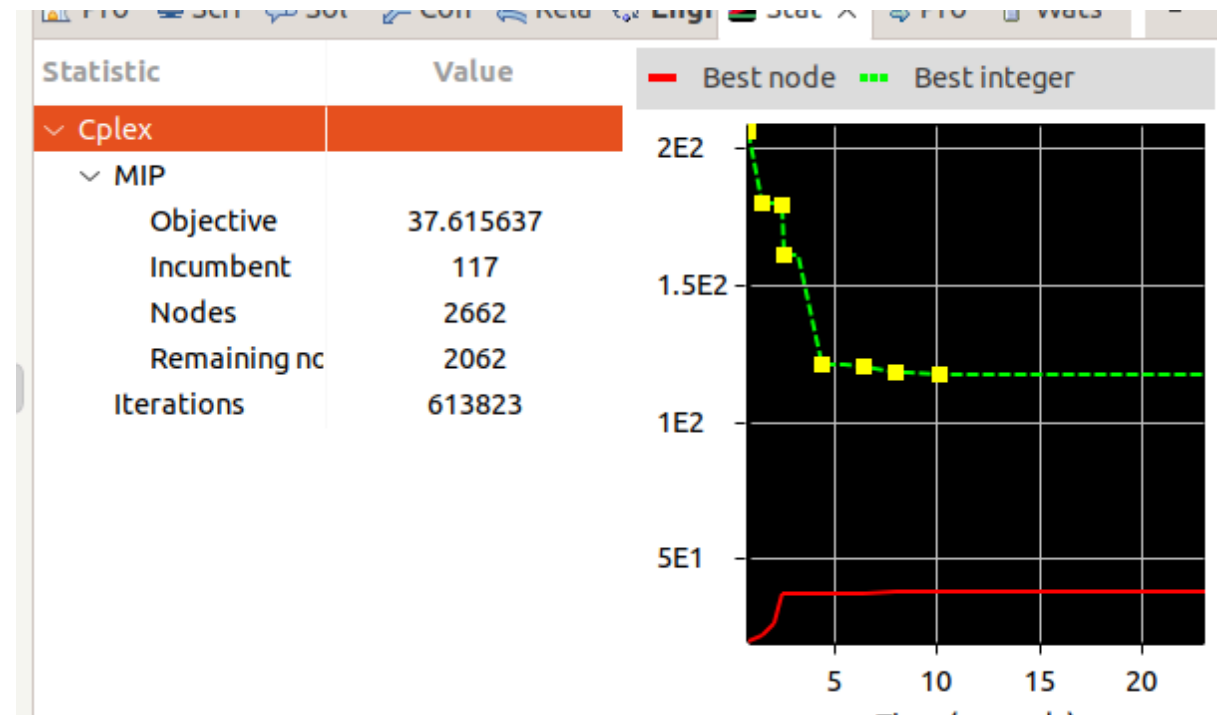

**Conclusión:**

La combinación de ambas restricciones limita la modelo de tal forma que su resolución se realiza en menos de 30 segundos. Es la que por ahora parece ser el mejor modelo ya que la respuesta no empeora y el tiempo de resolución es ampliamente mejorado.

6)

Caso 11 lavados sin simetría:

Nodo 138: 3

**Análisis:**

El resultado de este intento es muy similar a del punto 3 ambos tardan los 10 minutos disponibles en ejecutarse y encuentran de forma rápida la solución 117, donde se estancan disminuyendo en el resto de tiempo que tienen disponible en buscar mejores soluciones alternativas o probar que es la óptima. En este intento mejorar un poco más el gap acercándose a más al cero pero también aumenta más el **ItCnt**. Otra diferencia la primera solución encontrada, en el punto 3 es 300 y en este 220 . Este intento también encontró más soluciones enteras.

**Conclusión:**

El cambio de 15 a 11 lavados no parece afectar demasiado en este caso, no mejora ni la velocidad ni el rendimiento

Caso 11 lavados con simetría:

**Análisis:**

Tanto este caso como con 15 lavados llega a la solución de 117, pero en mi opinión hay tres grandes diferencias el tiempo, el gap y **ItCnt**. Si bien ambas soluciones son rápidas a comparación del resto de las probadas en el modelo este caso demora 9 segundos. Esto está altamente relacionado al **ItCnt** que se puede apreciar que nunca supera los 100,000, siendo el único de todos los intentos en lograrlo. Lo más interesante es que el gap es mejor el en punto 5, si bien ambos tienen la misma solución en el punto 5 se está más cerca de probar la optima.

**Conclusión:**

El rendimiento mejora, pero por alguna razón está más seguro de su solución en el punto 5. El cambio de 15 a 11 no parece ser tan significativo como el de simetría.

7)

Si bien en cuanto a tiempo la heurística no está tan mal, el resultado dista mucho del obtenido con plc. Mientras la heurística arroja una sola solución plc varía e intenta mejorar su solución en cada uno de los casos probado y según el tiempo que se disponga se lograrán mejores resultados, cosa que por lo menos en la heurística no pasa.

En común, ambos parecen priorizar los lavados largos primeros (en plc cuanto se descomenta la restricción de simetría) y esto parece ser de lo más importante a la hora de limitar el tiempo de ejecución.
